Professional:

Client: **Rob Delaney**

Patient #1111 DELANEY, Rob

Subjective Data

Rob is a 23-year-old man undertaking physical and cognitive rehab following an ABI six months ago. He recently started transport training with OT to meet his goal of catching the bus independently.
Homework prior to the session was for Rob to plan his route online to catch the bus to a friend's house later this week. He had a lot of trouble with this task and is feeling very frustrated.

Objective Data

When OT attempted to plan the bus route with Rob, he had a lot of difficulty staying focused on the task and distinguishing which bus routes traveled to his friend's address.

Assessment

Rob continues to exhibit signs of cognitive impairment evidenced by marked executive dysfunction and impaired concentration.
Likely to require additional 1:1 support to make progress on the goal of utilizing public transport independently.

Plan

OT to discuss Rob's need for additional 1:1 support at the team meeting tomorrow. Will request the provision of an OTA/Allied Health Assistant to complete a time-limited supported transport training program. Rob is agreeable to this plan.
